Why MicroServices **Now?**

- ✦ **Confluence of technologies**
 - ✦ **Cloud computing**
 - ✦ **Bandwidth**
 - ✦ **Languages (and supporting frameworks)**
- ✦ **Confluence of business needs**
 - ✦ **Silicon Valley innovators as role models**
 - ✦ **Accelerating business needs**
 - ✦ **Reduction of entry barriers for niche competitors**

Challenge 1

**Synchronous or
Asynchronous**

Chad Fowler vs. Fred George

- ✦ **Chad: Use Synchronous as default**
 - ✦ Algorithms typically described serially
 - ✦ Programmer understanding / productivity
- ✦ **Fred: Use Asynchronous as default**
 - ✦ Robustness should be primary goal
 - ✦ Supports better de-coupling
 - ✦ Teach the programmers

Challenge 2

Deconstructing the Database

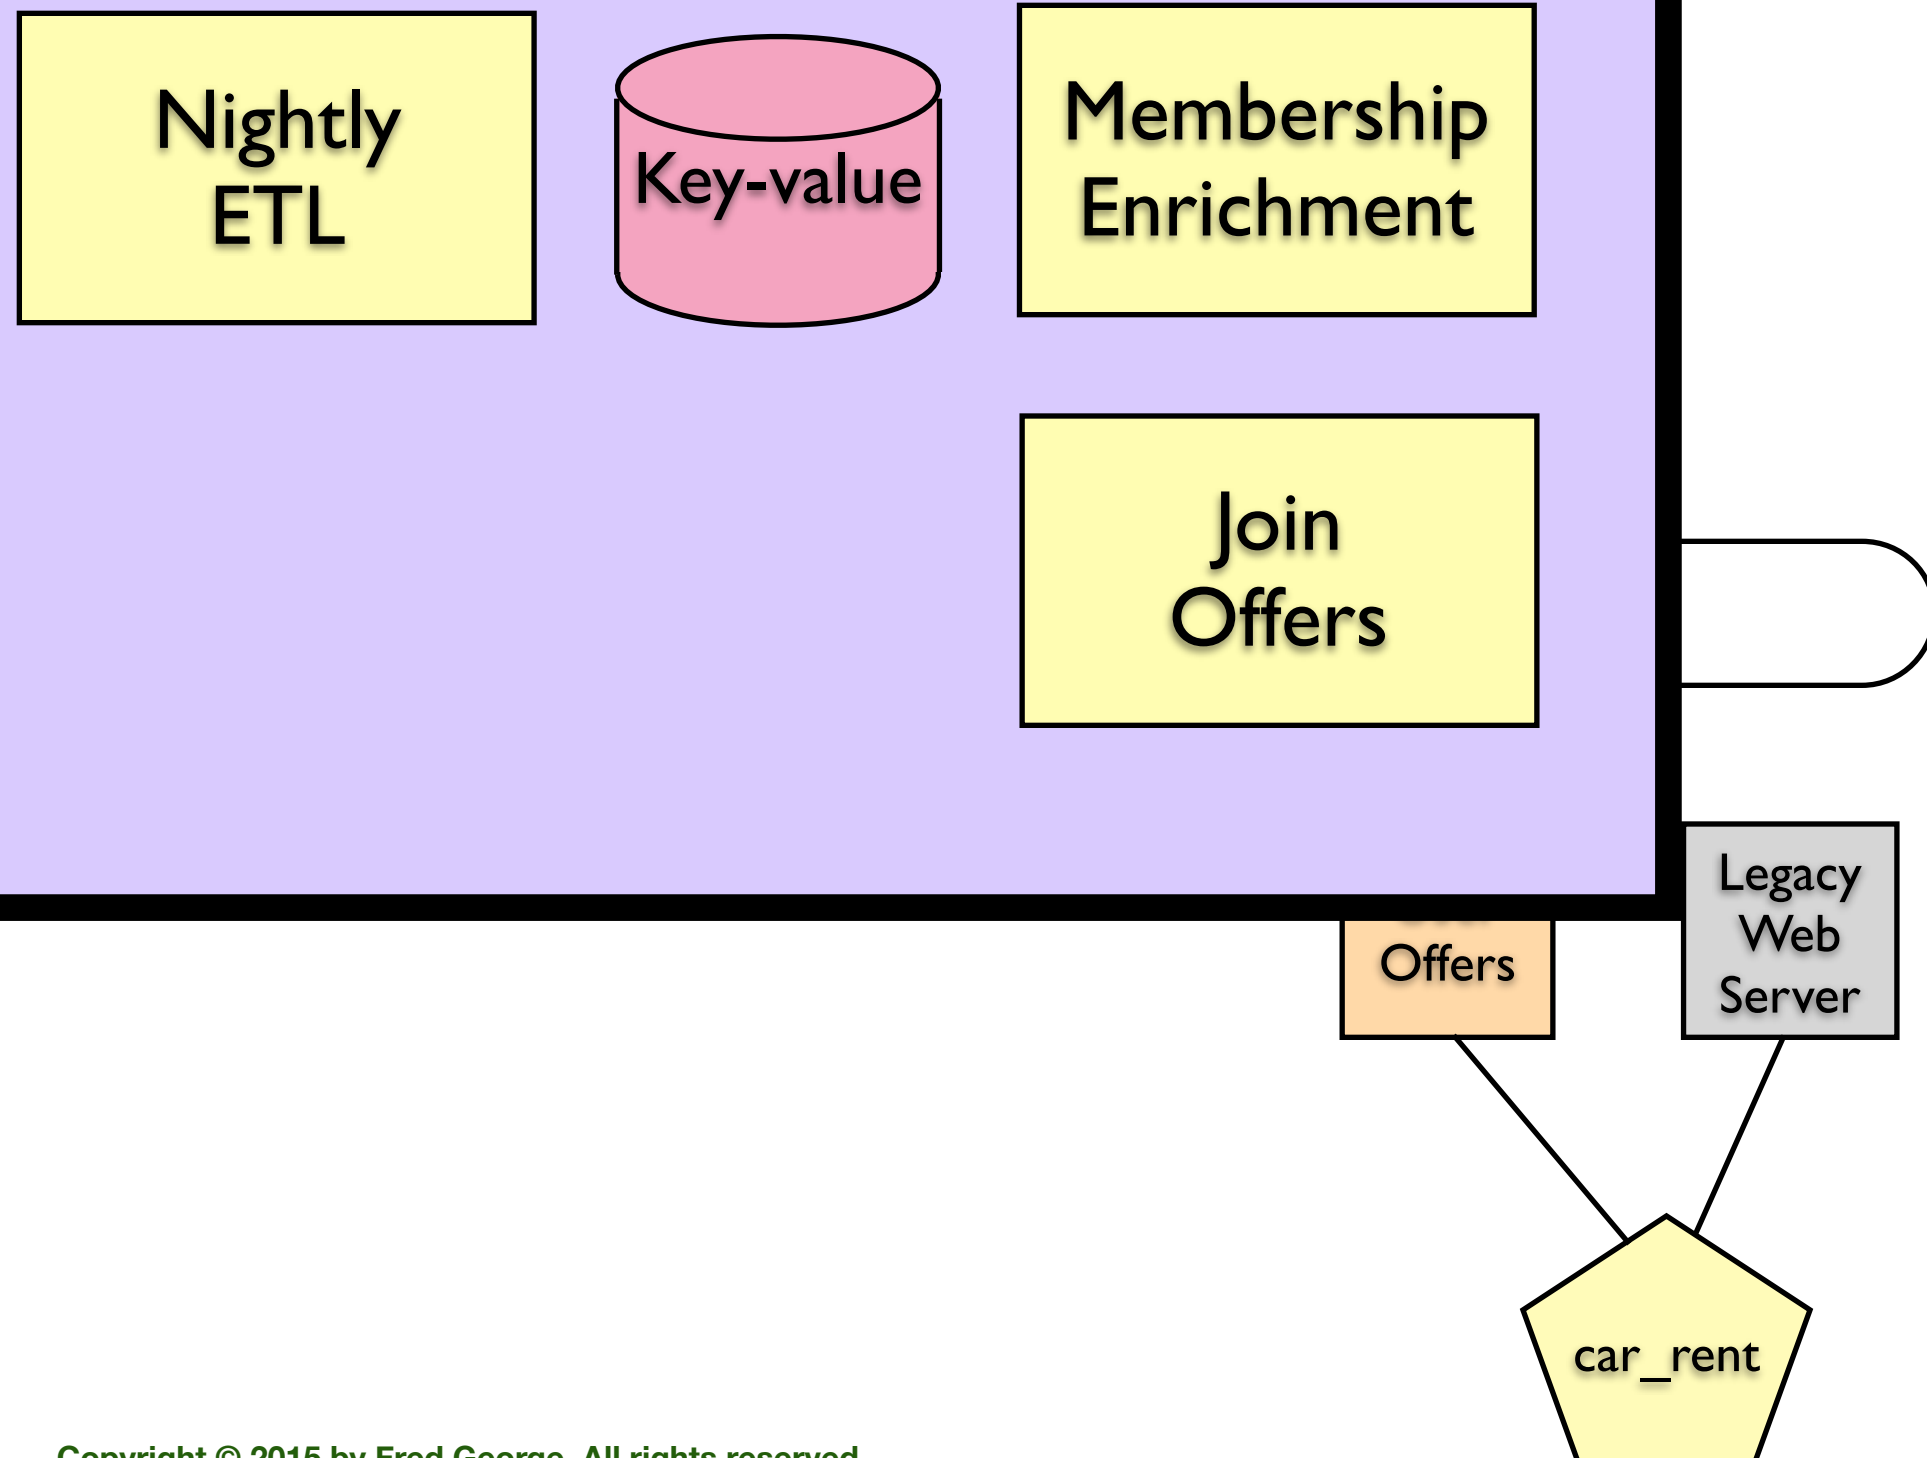

How Many Databases?

- ✦ **Fortune 100 View:**
 - ✦ **Entity-oriented; consistent**
 - ✦ **As few as possible**
- ✦ **Micro-service view:**
 - ✦ **DB per micro-service**
 - ✦ **Poly-glot (various NoSQL, SQL) + event bus**
 - ✦ **10% writable; fewer transactional**

Challenge 3

μ Services or Clojure

Services Like OO Classes

- ✦ **Conceptualization (Job)**
 - ✦ **Every service has one job**
 - ✦ **If two jobs, make two services**
- ✦ **Encapsulation**
 - ✦ **Service has its own persistence**
 - ✦ **If shared persistence, just one service!**

Clojure **Loves** Shared Data

3 Companies - 3 Variants

	Forward 2008 - now	Daily Mail 2012 - now	Outpace 2013-now
Number	300+	3 + dozens ^	25 v
Languages	Ruby, Node.js, Clojure, R, ...	Node.js, Clojure	Clojure
Coupling	DB w cron, RESTful, Kafka bus	RabbitMQ bus	Orchestrator, RabbitMQ bus

A New Hope...

Challenge 6-n

**What is a
MicroService?**

Taxonomy May be Useful (before it's too late)

- ✦ Synchronicity
 - ✦ Primary API access to service
- ✦ Average size / number ratio of services
 - ✦ Zones for clarity of labeling
- ✦ DB / service ratio
 - ✦ Expose potential hinderances to rapid deployment
